From the Editors

JGL Moving to Open Access

As scholars and academics, we are in the knowledge business: creating knowledge through our research; organizing knowledge through our development of teaching aids, databases, bibliographies, and related materials; and disseminating knowledge through our teaching and through the publication of our research. Getting knowledge into the hands of people who want it and to whom it will make a difference matters to all of us.

Accordingly we have come to be very interested in the “open access” movement, in academic publishing in general and in linguistics publishing in particular, by which the published articles are accessible to all readers without requiring a subscription to the journal. Costs related to the publishing process are covered by an Article Processing Charge (APC) levied on each published article. We have been exploring open access possibilities for the *Journal of Greek Linguistics*, and given our now almost ten-year association with Brill, we have opted to work within Brill’s open access framework. Thus, starting with this issue, we will be moving the journal to being an open access journal.

Here is what this move will mean for the journal and for authors:

- This move will take effect with this issue, and APCs will apply to all articles submitted from now on that are accepted for publication.
- APCs will be kept at a very low rate (c. 500 Euros) for the first couple of years, and will be covered by the authors or their funding bodies (their Universities, Research Councils, etc.). For authors who are not in a position to cover the APCs, special arrangements can be made, at the discretion of Brill.
- The entire journal will be available in Open Access, including all back issues.

For more information, please see the journal’s webpage at brill.com/jgl and the Brill Open Access pages at brill.com/brill-open.

In the meantime, readers should rest assured that our goals, as always, remain the same: publish the very best scholarship on the Greek language and make it accessible to the widest audience possible. We trust that this

experiment in a particular form of open access will allow us to continue to meet these goals. We appreciate any feedback from you, our readers and users, on this move.

Dag T.T. Haug, Brian D. Joseph, and Anna Roussou
