Manuscript to Print and Print to Print: On the Transmission History of Jacob ben Asher's *Tur Orah Hayyim*

Nadia Vidro
University College London

Abstract

This article is a case study in the transition of texts from manuscript to print. It looks at all surviving manuscripts and 15th–16th-centuries printed editions of Jacob ben Asher's *'Arba'ah Turim*, *Tur Orah Hayyim*. Based on a close textual investigation of *Tur Orah Hayyim*, chapter 428, it identifies and dates manuscript clusters, and establishes how different imprints are linked with the manuscript tradition and with each other. The article suggests that the Soncino 1490 imprint by Solomon Soncino exerted a crucial influence on the printed text of *Tur Orah Hayyim*. Whereas before imprints were independent and closely associated with individual manuscripts, Soncino 1490 became the archetype for all but one subsequent 15th–16th-centuries imprints, and direct dependence on manuscripts subsided.

Keywords

Jacob ben Asher – *'Arba'ah Turim*, *Tur Orah Hayyim* – Soncino – printing – manuscripts – textual transmission – calendar

This article is a case study in the transition of texts from manuscript to print. It looks at *Tur Orah Hayyim*, the first part of the influential 14th-century legal

* This article was researched and written as part of the ERC Advanced Grant project 'Calendars in Late Antiquity and the Middle Ages: Standardization and Fixation', at UCL. I thank Prof Sacha Stern (UCL) and the anonymous *Zutot* reviewers for their valuable comments and suggestions.

code *'Arba'ah Turim* (The Four Pillars) composed in Toledo by the eminent halakhist of Ashkenazi origins, Jacob ben Asher (Cologne, c. 1270 – Toledo, c. 1340).¹ *'Arba'ah Turim* was a widely used and authoritative work in Sepharad and Ashkenaz alike, and became a corner-stone of much subsequent halakhic writing, including Joseph Caro's *Shulhan 'Arukh*.

Tur Orah Hayyim (The Way of Life, henceforth טוה), is dedicated to laws of prayer, blessings, Sabbath and festivals. It is preserved in around 60 manuscripts and was printed over 20 times in the course of the 15th and 16th centuries. The manuscript transmission of טוה has been studied by Judah Galinsky, who identifies two recensions of the work, both attested in all geo-cultural areas.² The original short recension is closer, both stylistically and halakhically, to Jacob ben Asher's earlier works and to opinions of his famous father Asher ben Yehiel, but is less clearly formulated and has more difficult readings. The second, extended recension shows more independence from earlier works and introduces clarifications of wording and explanations of halakha. Most manuscripts of טוה do not consistently represent either recension but contain a mixed version of the text, following the short recension in some places and the extended recension in others, or mixing the two versions.³ Galinsky's conclusions are based on a macro-analysis of the entire book and do not take into account textual variants on the level of single words.

The transmission of טוה in print is virtually unstudied. Galinsky incorporated three incunabula into his corpus (Piove 1475⁴ and Hij 1485 representing the original recension, and Sp 1490 representing the extended recension) and included a brief section on the Warsaw 1882 imprint. Other studies in the history of printing *'Arba'ah Turim* do not pay attention to the formation and transmission of the text itself but rely on similarities between printers' materials, such as types and decorative borders, as well as printers' introductions and

included commentaries in order to establish relationships between various imprints.⁵

The purpose of this article is to study textual relationships between manuscripts and printed editions of *TOH* and to establish how different imprints are linked with the manuscript tradition and with each other. Identifying these links will help trace the formation of the printed *TOH* and estimate its proximity to the authorial text. It will also contribute to our understanding of early modern practices in publishing texts composed before the age of printing by addressing such questions as: Did printers work with manuscript copies or with earlier imprints? Did they reproduce individual manuscripts or create printer's copies by collating various manuscripts? On the other hand, the article does not look at the influence of printed *TOH* on manuscripts copied after print for the simple reason that very few such manuscripts survive, suggesting that few may have been produced.⁶

Methodologically, my analysis differs both from Galinsky's macro-analysis of entire manuscripts and from studies of paratextual elements in printed editions. It is based on a close investigation of a sample text taken from *TOH*, chapter 428⁷ paying attention to textual differences on the level of short phrases, single words and morphological and syntactical elements. The corpus for my analysis is made of all known pre-modern manuscripts⁸ and 15th- and

6 See footnote 8.

7 This chapter number is correct for most printed editions (see below). The numeration of chapters in manuscripts is unstable and is not always present (see Galinsky, 'The Four *Turim*,' 321 and nn. 51–52 there).

8 According to the *Merhav* catalogue of the National Library of Israel, the vast majority of *TOH* manuscripts were copied before the 16th century. The few surviving manuscripts of *TOH* dated in the catalogue to the 16th and 17th centuries are incomplete and do not preserve the text under consideration. The only manuscript dated in *Merhav* to the 18th century – SPB 211 – is, in fact, a 15th-century copy (see Appendix 1). Only two 19th-century manuscripts of *TOH* are recorded, both in a Yemenite hand: Ottawa, National Library of

16th-centuries printed editions that contain this chapter (I looked at one, sometimes two copies of each imprint). A list of analysed sources is given in Appendix 1. Because the studied portion of the text is small, all reached conclusions are provisional and require confirmation from the analysis of other passages. A number of observations on passages external to the studied chapter are used to support the results.

TOH, chapter 428 belongs to the book's calendar section and contains calendar reckoning rules, as well as two calendar tables and their description. It is mainly the description of tables that is analysed here. Although this choice was originally conditioned by my interest in the history of calendar tables in TOH,⁹ this sample text has a number of advantages. Its transmission is relatively uniform without significant additions or deletions and as such allows carrying out a micro-analysis without having to take into consideration any major recensional developments. Being part of the calendar section and associated with calendar tables the sample allows making some chronological observations. Furthermore, chapter 428 is one of the very few chapters preserved in the earliest surviving witness of TOH, a miscellany copied in 1380 (NY 527).

Calendar Tables in TOH, Chapter 428

TOH, chapter 428 includes two calendar tables and their description. The first table is a pre-calculated calendar said to cover the period 5055–6000 AM (1294/5–2239/40). The second table contains information on the arrangement of months, festivals, fasts and biblical pericopes in Jewish years of different types. Together the two tables give a reader all required information on any year of his interest. In the prose text Jacob ben Asher describes the structure and contents of the pre-calculated calendar and explains the short-hand

Canada, Saul Hayes Collection 74 and University of Toronto 5302. I was unable to check these manuscripts.

9 See N. Vidro, 'Calendar Tables in Manuscript and Printed *ʿArbaʿah ʿTurim: ʿTur Oraḥ Ḥayyim*, Chapter 428', *Journal of Jewish Studies* 69(1) (Spring 2018) 58–85. The main objective of this article is to identify, among many different attested calendars, the original calendar table included by Jacob ben Asher, to determine its sources and to follow its transmission and evolution in manuscripts and printed editions of TOH. Although I divide attested tables into families, these results are not directly relevant for the transition of TOH from manuscript to print because calendar tables in printed editions of TOH appear relatively late and are not based on those found in manuscripts.

notation employed therein. He then teaches readers how to use the tables, addressing audiences that have some understanding of how to handle a calendar table as well as those who have no calendar knowledge at all other than the date from Creation.

Analysis of the Manuscript Corpus

As a pre-requisite to understanding the manuscript to print transition of TOH, a textual study of the manuscript corpus was performed by collating surviving manuscript witnesses of the description of calendar tables in TOH, chapter 428. Data generated by the collation were analysed manually as well as with NeighborNet, a computerized method for creating networks from data sequences. Clustering textual witnesses with NeighborNet is discussed in Appendix 2. NeighborNet graphs included in this article do not represent stemmatic relationships, but simply put witnesses with similar readings closer together, i.e. visualize the structure of the corpus without claiming that certain copies are closer to the original or indicating lines of descent between manuscripts.

A clustering of all manuscripts that contain the description of tables in chapter 428 (Fig. 1) shows that the corpus of TOH manuscripts does not neatly divide into separate branches. This is a reflection of the fact that most manuscripts carry a mixed version of the text and were copied from multiple exemplars or an exemplar glossed with alternative readings as a result of an earlier collation.¹⁰ Nonetheless, a number of clusters can be identified, three of which are important for the study of the transmission of TOH from manuscript to print (colour-coded in red, blue and green in Fig. 1). These clusters are stably present for different data sub-sets and are supported by Galinsky's earlier findings.

10 Galinsky, 'The Four *Turim*,' 310–311. Such editorial activity of scholar-scribes is a common feature in the transmission of Jewish texts, see M. Beit-Arie, 'Publication and Reproduction of Literary Texts in Jewish Medieval Civilization: Jewish Scribality and its Impact on the Texts Transmitted,' in Y. Elman and I. Gershoni, eds., *Transmitting Jewish Traditions: Orality, Textuality, and Cultural Diffusion* (New Haven 2000) 225–247. For alternative copying practices and evidence of communally organized Hebrew manuscript copying in medieval Italy, see I.M. Sandman, 'The Transmission of Sephardic Scientific Works in Italy,' in Y.Tz. Langermann and R. Morrison, eds., *Texts in Transit in the Medieval Mediterranean* (University Park, PA 2016) 198–221.

FIGURE 1 *Clustering of manuscripts of TOH, chapter 428 obtained by NeighborNet. Bright red: cluster 1a (Sephardi-hand manuscripts of the original recension). Rose red: cluster 1b (Ashkenazi- and Italian-hand manuscripts of the original recension). Blue: cluster 2 (manuscripts of the extended recension). Green: cluster 3a, teal: cluster 3b (Ashkenazi and Italian manuscripts with a revised calendar section, based on the extended recension)*

Cluster 1 (colour-coded in shades of red) corresponds to what has been identified as the original recension of TOH.¹¹ It is composed of two sub-clusters: cluster 1a (bright red) consists of Sephardi-hand manuscripts, most probably copied on the Iberian peninsula; cluster 1b (rose red) consists of Ashkenazi- and Italian-hand manuscripts. Differences between these sub-clusters are demonstrated by Examples 1.1, 1.2, and 1.4 below. Three cluster 1b manuscripts, Bern 253 (15th century, Ashkenazi), Vat 555 (1435, Italian) and Viena 127 (1436,

11 Galinsky, 'The Four *Turim*,' 312.

Ashkenazi), contain an identical calendar for 1332/3–1503/4, 19-year cycles 269–277.¹² This table differs from the calendar described by Jacob ben Asher in the prose text and is specific to cluster 1b. Its starting point in 19-year cycle 269, 1332/3–1350/1, probably reflects the time when the table was introduced into the transmission of TOH, indicating that the Ashkenazi/Italian cluster 1b was in existence by the final years of this period at the latest.

Cluster 2 (colour-coded blue) is made up of Sephardi-, Ashkenazi-, and Byzantine-hand manuscripts. Manuscript Par 425 found in this cluster has been listed by Galinsky among the best surviving representatives of the extended recension of TOH.¹³ The extended recension is characterized by clearer, less ambiguous readings, and this comes through in our passage (see Examples 1.3 and 1.4). Readings in chapter 428 suggest that the extended recension is closer to Sephardi manuscripts of the original recension (cluster 1a) than to its Ashkenazi and Italian manuscripts (cluster 1b) (Examples 1.2, 1.4). A *terminus ante quem* for the publication of this recension is supplied by NY 527, which was copied in 1380 and is the earliest dated fragment of TOH, but an earlier dating can be suggested on the basis of cluster 3 (see below).

Cluster 3, with its sub-clusters 3a (green) and 3b (teal) includes manuscripts copied in Ashkenazi and Italian hands as well as a Sephardi-hand manuscript copied in Italy (for differences between the sub-clusters see Examples 1.2, 1.6).¹⁴ Cluster 3 builds on cluster 2 (Examples 1.1, 1.3, 1.4, 1.7) and has a set of readings not attested in other manuscripts (Examples 1.5, 1.9). Manuscripts in cluster 3 have an important feature in common: in them the chapter on the calculation of the astronomical new moon (Heb. *molad*) and equinoxes and solstices (Heb. *tequfot*)¹⁵ is reworded and significantly expanded, providing sample calculations and reasons for various calendar rules.¹⁶ The sample calculations always refer to year 5108 (1347/8) and, unless this example is random, 1347/8 must be the year when the treatise on calendar reckoning was expanded in cluster 3

12 In the Jewish calendar years are divided into 19-year cycles of intercalation, numbered from Creation: cycle 1 stands for years 1–19 AM, cycle 2 for years 20–38 AM, and so on. For a detailed explanation of the workings of the Jewish calendar see R. Sar-Shalom, *Gates to the Hebrew Calendar* (Hebrew) (Netanyah 1984).

13 Galinsky, 'The Four *Turim*,' 312.

14 Camb 656, copied in Italy in a Sephardi hand, contains only the second half of the prose description of tables in TOH, chapter 428. Although it can be attributed to cluster 3a on the basis of the included text, for computational reasons it is not included in the NeighborNet graph in Fig. 1.

15 Chapter 427 in most printed editions.

16 First described by Galinsky, 'The Four *Turim*,' 337.

manuscripts. This intimates that cluster 3 split off around this date and that cluster 2, on which cluster 3 is based, had been in existence before that.

That clusters 1b and 3, constituted by manuscripts copied in Ashkenazi and Italian hands, allude to 1332–1350/1 and 1347/8 respectively suggests that TOH spread out of its native Spain at a very early date, close to its composition time c. 1330.¹⁷ This dating is supported by other evidence that *'Arba'ah Turim* was known in Italy and Ashkenaz already in the 14th century. A French rite siddur copied in Northern Italy in 1395 cites *'Arba'ah Turim* in its halakhic marginal glosses.¹⁸ A late 14th-century Ashkenazi sage Shalom ben Isaac Neustadt knew *'Arba'ah Turim* but was unimpressed with it, whereas his pupil Jacob ben Moses Levi Moelin (1365–1427) studied it extensively and testified to its popularity among Ashkenazi Jews.¹⁹

Examples of Textual Variants

Example 1.1

cluster 1a	כמניין שני המחזורים
cluster 1b	כמניין שנים של מחזור
cluster 2, cluster 3 (a and b)	כמניין שני המחזור

Example 1.2

clusters 1a, 2, 3a	וגם ידע
cluster 1b	וגם צריך לידע
cluster 3b	וגם יודע

Example 1.3

cluster 1 (a and b)	ותחת כל מחזור כמה מונים לבריאת עולם
clusters 2 and 3 (a and b)	ותחת כל מחזור כתוב כמה מונים לבריאת עולם

clusters 1 (a and b), 3b	ובמקום שיכלה מניינו
cluster 2	ובמקום שכלה מניינו
cluster 3a	ובמקום שיצא מניינו

Example 1.7

clusters 1 (a and b)	מצינו
clusters 2, 3 (a and b)	מצאנו

Example 1.8

clusters 1a, 2	צריך שידע
clusters 1b, 3 (a and b)	צריך לידע

Example 1.9

clusters 1 (a and b), 2	עד תשלום ששת אלפים שנה
cluster 3 (a and b)	עד תשלום תקל שנה

Analysis of the Printed Corpus

Let us now turn to chapter 428 in printed editions of TOH published in the 15th and 16th centuries.²⁰ As is shown in Fig. 2, most incunabula editions apart

20 Twenty-one editions of TOH are considered in this survey, some included in the full *Arba'ah Turim*, others limited to TOH only (see Appendix 1). A small number of editions are excluded: in Naples 1492 (Joshua Soncino) the calendar section has not survived in the only publicly accessible copy (see n. 23); the small format edition published by Vincenzo Conti in Cremona in 1558 is identical with his larger format edition published in the same year, which latter is included in the survey; Riva di Trento 1561 (printing shop of Antonio Broën) is identical with Riva 1560 (Joseph Ottolenghi) apart from the title page where the

FIGURE 2 Clustering of incunabula imprints of *TOH*, chapter 428 obtained by NeighborNet. Rose red: incunabula. Black: manuscripts most closely related to the incunabula

from Sonc 1490, Bresc 1497 and Const 1493 are independent from one another, represent different manuscript clusters and are closest with manuscripts copied in the same geo-cultural areas as the imprints themselves.

1. Plove 1475 represents the Ashkenazi/Italian version of the original recension (cluster 1b) and is closest to Vat 555 (Italy, 1435/6).
2. Mant 1476 is very close to Ox 621 (Italy, 1494; cluster 3a) and reflects all its individual features. Ox 621 is later than the Mantua imprint but they clearly come from the same or very close exemplars not directly underlying any other surviving copy. Like Ox 621 and other manuscripts in cluster 3, Mant 1476 contains a revised version of the calendar section and is the only imprint to do so.

name and printer's device of Joseph Ottolenghi were deleted; Lublin 1599 (Kalonymus ben Mordecai Jaffe) does not contain the relevant chapter. For references on printing *Arba'ah Turim* see n. 5.

3. Hij 1485 represents a Sephardi version of the original short recension of TOH (cluster 1a) and is closest with Lon 62 (15th century, Sepharad). Leir 1495 is also closely related to the Sephardi short recension and perhaps to the Hajar imprint itself, although it shows minor influence of the extended recension. In addition to their overall textual similarity, Lon 62, Hij 1485 and Leir 1495 share a closing formula *תמו הלכות ראש חדש וקבועו* (or *מציל אביון* in Leir 1495). This closing formula, based on Psalms 72:12 *לֹא יֵאָזֵז עֹזֶר וְעֹנֵי מְשׁוּעַ אֶבְיֹן מְשׁוּעַ*, is uncommon²¹ and confirms the connection between the manuscript and the imprints.
4. Sp 1490 is very closely associated with Par 425 (15th century, Sepharad), a flagman manuscript for the extended recension (cluster 2).
5. Sonc 1490 is not a straightforward representation of any particular manuscript or manuscript sub-group. It is clearly based on multiple exemplars of the short, original recension and moves freely between cluster 1a and cluster 1b readings (it follows cluster 1 in all examples given above, siding with cluster 1a in Examples 1.1 and 1.8 and cluster 1b in Examples 1.2 and 1.4). Importantly, it exhibits textual variants which are not attested in any surviving manuscripts. Among the most conspicuous cases are:

Example 2.1

The phrase *יט קביעות שורה וכל* is reworded to *יט קביעות שורה*;

Example 2.2

The phrase *בשורה של מניין שני המחזור* is printed with two deviations unattested in the manuscript tradition. It reads *ממנה בלוח הראשון מראש המחזור הוא בשורה של מנין שתי המחזורים*. Whereas *ממנה* instead of *וימנה* is a clear blunder, replacing *שני המחזור* 'the years of the cycle' with *שתי המחזורים* 'the two cycles' is a failed reinterpretation of the text;

Example 2.3

In the phrase *יעיין בלוח הראשון תחת איזה מחזור ימצא מנין הסמוך למנינו* the 3m.sg. verb *ימצא* is replaced with a 2m.sg. form that does not fit other

²¹ This formula could not be found in other manuscripts recorded in the SfarData database (<http://sfardata.nli.org.il/>). On scribes' closing formulas see M. Beit Arié, *Hebrew Codicology. Historical and Comparative Typology of Medieval Hebrew Codices Based on the Documentation of the Extant Dated Manuscripts until 1540 from a Quantitative Approach*, Pre-publication internet version 0.5 (2015) 143–147.

verbs in the passage, all of which are in 3m.sg.: עין בלוח הראשון תחת איזה
מחזור תמצא מנין הסמוך למנינו.

6. The last two incunabula of TOH, Const 1493 and Bresc 1497, closely follow Sonc 1490's readings, including the above-mentioned mistakes and reinterpretations not attested in the manuscripts, and appear to have used it as their base text. Whereas Sonc 1490 and Bresc 1497 were printed in Italy by members of the same family, Solomon and Gershom Soncino respectively, the quick transit of the Soncino text from Italy to Constantinople may appear more surprising but can be explained. Const 1493 was printed by the brothers David and Samuel ibn Nahmias, Sephardi printers who fled to Constantinople. They seem to have travelled via Naples in 1492, where they stocked on North Italian paper and came into possession of semi-cursive types previously used in Joshua Soncino's printing shop in this city – supplies which they used to print their *Arba'ah Turim*.²² They could have obtained a copy of Sonc 1490 at the same time.²³

If we now look at editions of TOH printed in the 16th century, it becomes clear that all of them are based on incunabula imprints rather than manuscripts (see Fig. 3 below). Moreover, only one 16th-century imprint does not exhibit influence of the Soncino's text. Sal 1530 is directly based on Mant 1476 and repeats all of its readings and mistakes, both those that are shared with Ox 621 and those that are not. All other 16th-century imprints of TOH are to a greater or lesser extent Soncino-based. Fano 1516 by Gershom Soncino and Const 1540 by his son Eliezer Soncino follow Sonc 1490 with minor variations. All editions printed in Venice (1522, 1550, 1563, 1566, 1589) closely represent the text as it was developed by the Soncinos with its peculiarities exemplified above.

Editions published in Central Europe are in a less straightforward relationship with the Soncino editions and may be seen as cousins. Crac 1538 has some of the readings found in Soncino imprints, although clear typos are weeded out (such as ממנה instead of וימנה in Example 2.2 above). It shows influence of Ashkenazi manuscripts like Hamb 34 and NY 8188 and occasionally lumps together Soncino variants with those in the manuscripts. Thus, the Soncino

²² Offenberg, 'The Printing History,' 224–225, 229.

²³ Unfortunately, it is not possible to establish how Const 1493 relates to Joshua Soncino's edition of TOH printed in Naples in 1492: only one copy of this edition survives in a public institution and in this copy the entire calendar section has been lost (*Gesamtkatalog der Wiegendrucke* (online), number M1040610, accessed December 1, 2016).

FIGURE 3 Clustering of 15th- and 16th-centuries imprints of *ToH*, chapter 428 obtained by NeighborNet. Rose red: incunabula. Green: 16th-century imprints. 'Magnifier' feature was applied to the region of 16th-century imprints for increased readability

text reads *ונגד תחת כל מחזור כמה מונין לבריאת עולם בתחלתו*. In Hamb 34 and NY 8188 the text is slightly different: *ונגד כל מחזור כתוב כמה מונין מבריאת עולם בתחלתו*. The more explicit reading *כמה מונין כתוב* instead of *כמה מונין* is found in manuscripts and prints influenced by the extended recension, including Hamb 34 and NY 8188 (see Example 1.3). The variant *ונגד* is specific to Hamb 34 and NY 8188. In Crac 1538 we read *ונגד תחת כל מחזור כתוב כמה מונין לבריאת עולם בתחלתו*, a clear doubling-up. A similar doubling-up is the Cracow reading *וכל שורה יט קביעות שורה* combining the manuscript reading *יט קביעות שורה* with the Soncino's *שורה וכל יט קביעות שורה* (Example 2.1).

Prag 1540, with the glosses and longer commentary by Abraham ben Avigdor, at the time the chief rabbi of Prague and the editor of the imprint, is the least certain case. This edition shows none of the Soncino's readings that are not found in the manuscript tradition. However, it does not follow any particular group of manuscripts and in many cases where manuscripts present a variety of readings makes the same choices as the Soncino texts (e.g., it

differs from Sonc 1490 in the above Examples 1.1 and 1.3 only, where it follows the less ambiguous readings of clusters 2 and 3). Although it cannot be totally excluded that this imprint is independent and based on a selection of manuscripts, mainly of the short recension, it appears more likely that Prag 1540 is a Soncino-based edition collated with extended recension manuscripts. This conjecture is corroborated by a fragment of Sonc 1490 with hand-written (and potentially autograph) glosses by Abraham ben Avigdor, where some words and a chapter number have been crossed out and substituted by alternative readings, which latter appear in Prag 1540.²⁴ A similar proofreading of Sonc 1490 may have led to the shaping of chapter 428 as it is published in Prag 1540.²⁵

Augs 1540, based on the text of *'Arba'ah Turim* corrected and annotated by Abraham ben Avigdor,²⁶ presents a similar picture but has a few more Soncino features compared to Prag 1540 (e.g., תמצא in Example 2.3). One doubled-up reading is attested: Soncino imprints follow Sephardi short recension manuscripts (cluster 1a) and read באיזה מחזור הוא וכמה הוא, whereas in most other manuscripts as well as in Prag 1540 the final two words are ובמה בו. Augs 1540 keeps both options and finishes ובמה בו הוא. The text in Crem 1558, and in Riva 1560 printed on its basis, closely follows Augs 1540. It has been known that Crem 1558 includes Abraham ben Avigdor's glosses according to the Augsburg edition.²⁷ This study suggests that not only the glosses but its main text itself is based on Augs 1540.

The numeration of chapters in the imprints shows the same convergence towards a standard text. As mentioned above, chapter numbers are unstable and are not always present in manuscripts of TOH. For example, chapter 428 is numbered 416 in Camb 1199, 428 in Lon 62, 438 in Par 430 and 445 in Vat 600. In early incunabula, this chapter has the same number as in their respective closest manuscripts: chapter 426 in Piove 1475 and Vat 555 (cluster 1b), chapter 421 in Mant 1476 and Ox 621 (cluster 3a), chapter 428 in Hij 1485, Leir 1495 and Lon 62 (cluster 1a), unnumbered in Sp 1490 and Par 425 (cluster 2). In Sonc 1490 the

26 See the printer's introduction: יגענו בכל ילתינו עד כי הגענו לרשותינו ספר מדיק ככל חפצינו מוגה בדקדוק רב מפי הרב מורינו ואלופינו הגאון מהרר אברהם מפראג מאור דורינו ומתוכו הגהנו מלאכתנו.

27 On the relationship between Augs 1540, Const 1540, Crem 1558, and Riva 1560 see *Bibliography of the Hebrew Book* (online), numbers 136087, 178160, accessed December 14, 2016.

chapter is numbered 428, and this number is found in all subsequent imprints apart from Sal 1530 (chapter 421, as in Mant 1476) and Prag 1540 (chapter 427).²⁸

Supporting Considerations from Other Parts of TOH

Additional chapters of TOH must be analysed in order to verify these conclusions. However, a number of observations external to the description of tables in chapter 428 indicate their validity. Firstly, the attribution of incunabula to underlying clusters of manuscripts revealed by this chapter fits exactly with that established earlier for Piove 1475, Hij 1485, and Sp 1490 on the basis of a macro-analysis of the corpus.²⁹ Secondly, in describing the textual status of the Warsaw 1882 edition Galinsky demonstrates that this imprint deviates from the original recension of the work found in Sephardi manuscripts and carries modifications and additions associated with Ashkenazi and Italian copies.³⁰ Galinsky gives seven supporting examples, from chapters 1, 30, 41, 214, 484, 486, and 694, and lists manuscript witnesses for each variant reading. The exact details of the readings are immaterial for the present argument; suffice it to say that all variants involve relatively large-scale changes beyond the level of single words or short phrases. No single manuscript checked by Galinsky contains all seven readings, indicating that they must have entered the print tradition through a variety of sources. A check of editions printed in the 15th and 16th centuries shows that in the period before 1490 Iberian imprints (Hij 1485, Sp 1490, and Leir 1495) do not include any of the variants, and Italian imprints are independent in their choice. Sonc 1490 includes four of the variants (in chapters 30, 41, 484, and 694), not attested together in any single examined manuscript, and is the first imprint to include variant readings in chapters 484 and 694. From then on, all imprints (apart from Sal 1530, which follows Mant 1476) include the four variants found in Sonc 1490.³¹ Prag 1540 adds the variant in chapter 214 and the earliest edition to have all seven non-original readings that I am currently aware of is Augs 1540. All seven variants are also found in

28 The chapter number 427 rather than 428 in Prag 1540 corroborates my hypothesis that this imprint is based on a copy of Sonc 1490 proofread by Abraham ben Avigdor. Indeed, in the Sonc 1490 copy with Abraham ben Avigdor's hand-written glosses, chapter number 169 is corrected to 168, corresponding to the reduction from 428 to 427 in Prag 1540. See <https://www.kedem-auctions.com/he/node/18863>, accessed December 1, 2016.

31 I was unable to check this in Crac 1538.

Crem 1558 and Riva 1560. Here as in the description of tables, incunabula imprints before 1490 are independent, whereas all post-1490 imprints apart from Sal 1530 follow the pattern set by Soncino 1490, with Central European imprints and Italian imprints that are based on them representing a further development within the Soncino's tradition.

Conclusions

Analysis of TOH, chapter 428 in 15th- and 16th-centuries printed editions of TOH suggests that the 1490 imprint by Solomon Soncino is a watershed in the history of printing TOH. Before, imprints were independent and show close association with individual locally copied manuscripts. In 1490 Solomon Soncino created a text which was based on a variety of manuscript sources and does not directly reflect any particular group of manuscripts although it is closest to the original recension of TOH. This imprint became the archetype for all but one subsequent 15th–16th-centuries imprints of TOH and direct dependence on manuscripts subsided, albeit a cousin group of imprints from Central Europe and Italy may reflect a version of Soncino 1490 collated with extended recension manuscripts prevalent in Ashkenaz. A sporadic check of some later editions, such as Hanau 1610, Berlin 1702 and Warsaw 1861, attributes them to the Soncino family, with Hanau 1610 joining the Central European/Italian cousin branch.

These results were obtained by a close textual investigation of one section of the book (part of chapter 428 in most printed editions). This section has not undergone a substantive revision in the manuscript tradition but features modifications on the level of single words and short phrases. As such it can be regarded as a model for TOH printers' practices when dealing with the basic text of the work. Evidence from other passages, affected by larger-scale recensional changes, is in line with the presented findings. Further research is needed in order to verify and explain the influence exerted by Solomon Soncino's 1490 edition on the printed text of TOH.

Appendix 1 (cont.)

Siglum	Classmark	Period	Hand (and place of copying if known to be different)
Par 422	Paris, BNF, heb. 422	1487	Ashkenazi (in Italy)
Par 425	Paris, BNF, heb. 425	15th century	Sephardi
Par 426	Paris, BNF, heb. 426	1455	Ashkenazi (in Italy)
Par 428	Paris, BNF, heb. 428	1476	Ashkenazi (in Italy)
Par 429	Paris, BNF, heb. 429	15th century	Ashkenazi
Par 430	Paris, BNF, heb. 430	15th century	Ashkenazi
Parma 2235	Parma, Biblioteca Palatina, Cod. Parm. 2235	15th century	Ashkenazi
Parma 3262	Parma, Biblioteca Palatina, Cod. Parm. 3262	1459	Sephardi (in Italy)
Rome 3141	Rome, Biblioteca Casanatense, 3141	15th century	Sephardi
SPB 209	St. Petersburg, RNL, Evr I 209	1419	Ashkenazi
SPB 210	St. Petersburg, RNL, Evr I 210	14th–15th century	Ashkenazi
SPB 211 ^a	St. Petersburg, RNL, Evr I 211	c. 1455/6, before 1502	Ashkenazi
Strasb 4016	Strasbourg, BNU, 4016	15th century	Ashkenazi
Tor 5–14	Toronto, University of Toronto, Friedberg 5–014	14th century?	Sephardi
Trin 1225	Cambridge, Trinity College, F 12 25	14th century?	Ashkenazi
Vat 555	Vatican, BAV, Ross. 555	1435	Italian
Vat 600	Vatican, BAV, Ross. 600	14th–15th century	Sephardi
Vien 127	Vienna, ONB, Cod. hebr. 127	1436	Ashkenazi
Zur 124	Zurich, Braginsky Collection, 124	c. 1446	Ashkenazi

a SPB 211 is dated to the 18th century in the *Merhav* catalogue. This dating is clearly erroneous, as is shown both by the handwriting and by marks left by the main scribe and by a later user in the calendar table on fol. 54v. The scribe marked out years 1455/6–1464/5; the user – the 19-year cycle 277, years 1484/5–1502/3.

Imprints

Editions which include the full *ʿArbaʿah Turim*:

Siglum	Imprint
Piove 1475	Piove di Sacco 1475 (Meshullam Cozy)
Sonc 1490	Soncino 1490 (Solomon Soncino)
Const 1493	Constantinople 1493 (David and Samuel ibn Nahmias)
Fano 1516	Fano 1516 (Gershom Soncino)
Ven 1522	Venice 1522 (Daniel Bomberg)
Sal 1530	Salonika 1530 (Judah Gedaliya)
Augs 1540	Augsburg 1540 (Hayyim Shahor)
Const 1540	Constantinople 1540 (Eliezer Soncino)
Crem 1558	Cremona 1558 (Vincenzo Conti), large edition
Riva 1560	Riva di Trento 1560 (Joseph Ottolenghi)

Editions of TOH only:

Siglum	Imprint
Mant 1476	Mantua 1476 (Abraham Conat)
Hij 1485	Hijar 1485 (Eliezer Alantansi)

Prag 1540	Prague 1540 (Gershom ben Solomon ha-Kohen)
Ven 1550	Venice 1550 (Marco Antonio Giustiniani)
Ven 1563	Venice 1563 (Alviso Bragadin)
Ven 1566	Venice 1566 (Giovanni Grypho)
Ven 1589	Venice 1589 (Giovanni di Gara)

Appendix 2: Clustering Textual Witnesses with NeighborNet

NeighborNet³² is a computerised method for creating networks from data sequences. It is a data visualization tool, meaning that it does not attempt to reconstruct genealogical relations between objects of study but rather identifies and displays patterns in the data, separating objects into groups on the basis of shared traits. In text historical studies, the objects of study are copies of a text and their traits are textual variants found in different copies.

An important feature of the NeighborNet algorithm is that it does not assume data to be tree-like and divisible into clear-cut branches. It allows for contamination and hybridization of traits, directly incorporating it into the visual representation in the form of reticulation (box-like structures in Figs. 1, 2 and 3). If, however, data are tree-like, the method produces a tree-like graph. Therefore, the shape of a graph gives an instant visual clue to the structure of the data. NeighborNet's ability to represent contamination is important for text historical analysis. It becomes particularly relevant when studying Jewish manuscripts, many of which were copied by scholar-scribes engaged in editorial work, including copying from multiple exemplars, re-interpreting and improving original readings, etc., all of which make it difficult to unambiguously assign manuscripts to families and establish relationships between copies.³³ When some readings in a manuscript associate it with one group of copies and other readings – with another group of copies, NeighborNet does not ignore this conflict in the data (as an algorithm generating trees would) but indicates it by inter-connections among the branches.

32 NeighborNet is included in the SplitsTree4 package available from www.splitstree.org. For a discussion of NeighborNet among other methods of phylogenetic analysis, including mathematical and computations principles underlying these algorithms and examples of their application, see D.H. Huson and D. Bryant, 'Application of Phylogenetic Networks in Evolutionary Studies,' *Molecular Biology and Evolution*, 23/2 (2006) 254–267; D. Bryant and V. Moulton 'Neighbor-Net: An Agglomerative Method for the Construction of Phylogenetic Networks,' *Molecular Biology and Evolution*, 21/2 (2004) 255–265; D. Morrison, 'Networks in Phylogenetic Analysis: New Tools for Population Biology,' *International Journal of Parasitology*, 35 (2005) 567–582; D. Bryant, F. Filimon, and R. Gray, 'Untangling our past: Languages, Trees, Splits and Networks,' in R. Mace, C. Holden, and S. Shennan, eds., *The Evolution of Cultural Diversity: Phylogenetic Approaches* (London 2005) 69–85. On computer-aided stemmatics see T. Roos and T. Heikkilä, 'Evaluating Methods for Computer-Assisted Stemmatics Using Artificial Benchmark Data Sets,' *Literary and Linguistic Computing* 24/4 (2009) 417–433.

33 For references see footnote 10.

A NeighborNet graph consists of nodes, branches, and boxes formed by sets of parallel edges. The outer nodes represent objects of study; the internal nodes cannot be interpreted as ancestors, but simply arise as a result of conflicts in the data. Branches and boxes represent partitions in the data (called 'splits' in phylogenetic terminology), with individual branches indicating uncontaminated tree-like data and boxes showing contamination. The length of a branch or of an edge of a box reflects the amount of traits that support this split. The dissimilarity between any two objects is measured as the shortest path along the branches and box edges of the graph that connects the corresponding nodes. The closer the nodes are on the graph, the more similar the objects.

To extract text historical information from a NeighborNet graph plotting copies of a particular text, one must look at the following aspects. Firstly, the shape of a graph indicates the level of contamination in the corpus, with more boxes meaning more complexity, and less clear division into families. Secondly, splits in the graph visualize how copies are divided into groups (e.g., red-, blue- and green-coded clusters in Fig. 1). Thirdly, the length of branches and parallel box edges is proportionate to the number of variant readings that distinguish a copy from its group members or a group of copies from the rest of the corpus. Thus, Fig. 1 shows that Mun 255 is closer to Rome 3141 than to Lon 62 (cluster 1a, red), and cluster 3 (shades of green) has more readings unattested in the rest of the corpus than cluster 2 (blue). Last but not least, it is important to remember that NeighborNet graphs do not represent genealogical relations, so that ancestors are placed at the same level with their descendants. Once clusters are identified, stemmatic relations within each cluster or between clusters can be studied by other methods.
